

GTM Engine — End-User Onboarding

How to get your AI go-to-market teammate running, using the desktop app. No technical background needed. Budget ~30 minutes, most of it the engine reading your company.

What this is. GTM Engine is an AI teammate for selling. You give it your company **once** — website, product docs, ICP, sales materials — and from then on every task (finding prospects, prepping for calls, drafting outreach, building decks and content) already knows your business, your voice, and your buyers. **You approve everything before it goes out. Nothing sends on its own.**

The one thing to understand first: you will **not** open a "terminal", write code, or type commands. You talk to the assistant in plain English — *"download this," "set me up," "find prospects"* — and **it does the technical work for you**. When you see a command in this guide, it's something the assistant runs on your behalf, shown only so you know what's happening.

Your steps at a glance

Step	What you do	~Time
1	Install the Claude desktop app	5 min
2	Create a GitHub account	3 min
3	Get the engine onto your computer <i>(the Claude desktop app does it)</i>	5 min
4	<i>(optional)</i> Already have a company profile? Drop it in	2 min
5	Onboard — "set me up," hand over your materials, review	10 min
6	Connect your data tools <i>(optional — do this later)</i>	5 min
7	Start working	—

Step 1 — Install the Claude desktop app

Use the Claude desktop app. It's the one built to open a folder on your computer and do the setup work for you.

1. Download it from claude.ai/download (Mac or Windows).
2. Install it and sign in.
3. You'll need a **Claude Pro or Max** subscription — this is the "brain." No separate technical key required.

Why Claude specifically? GTM Engine is built as a Claude-native plugin — its skills and the "set me up" experience are wired directly into Claude's plugin system, so ChatGPT, Gemini, and Copilot can't load or run them today. **A version that works with Gemini and Codex is coming soon** — until then, GTM Engine runs in the Claude desktop app.

Step 2 — Create a GitHub account

GitHub is the website where the engine's code lives (think of it as the shelf the engine sits on). You need an account to get a copy.

1. Go to github.com/signup.
2. Enter your email, pick a username and password, and verify your email. The free plan is all you need.

Step 3 — Get the engine onto your computer

You don't download anything by hand — **the Claude desktop app does it for you.**

1. Open the Claude desktop app and start a new project, pointing it at an **empty folder** on your computer (for example, make a folder called `gtm-engine` in your Documents and choose that).
2. In the chat, paste this:

Download the GTM Engine from <https://github.com/henryroxstar/gtm-engine> into this folder and get it ready to run.

3. Claude will copy the code down and prepare it. If it asks permission to run a step, or to install a helper (like Node or Python), **say yes** — that's normal and safe.

Jargon check: copying the code down is called "*cloning a repository*." You'll see Claude mention it. You don't have to do anything — just approve when asked.

When it's done, you have the engine on your computer. That folder **is** the engine.

Step 4 — Already have a company profile? Drop it in (*optional*)

First time setting this up? Skip straight to Step 5.

If a colleague already ran setup for your company, or your admin handed you a folder, you don't need to start from scratch:

1. Find the folder your admin/colleague gave you — it's named after your company (e.g. `acme`) and contains a file called `PROFILE.md` plus a few other folders (`knowledge`, `products`, `output`).
2. Open the `gtm-engine` folder from Step 3, then open the `profiles` folder inside it.
3. Drag your company's folder in there, so you end up with `gtm-engine/profiles/acme/` — sitting next to a folder called `_template`.
4. In the chat, say: **"I already have a profile for [your company name] — activate it."**

Claude will confirm it found your profile and switch into it. You can skip Step 5 (onboarding) entirely and go straight to Step 6.

Step 5 — Onboard: "set me up"

This is the important one — it teaches the engine who you are. It happens in three quick parts, all in plain English.

Part A — Set me up

In the chat, type (with your real website):

Set me up — our website is yourcompany.com

The engine will:

1. **Read your website** and draft your whole company profile — who you are, your ICP and buyer personas, your voice, competitors, content themes, products, brand.
2. **Ask only what a website can't tell it** — your monthly budget cap for paid tools, which markets you're focused on, and how you sign your outreach.
3. **Show you everything to review** before it goes live, then switch it on.

What's a "profile"? It's the engine's memory of your company. Every task reads it, so you never have to re-explain your business again.

Part B — Hand over your materials

The more real material you give it, the more it sounds like you and sticks to your facts. Give it any of:

- Company / product background — decks, one-pagers, website copy, FAQs, product specs
- Your **ICP, buyer personas, GTM plan**, positioning and messaging
- Case studies, customer stories, testimonials

- A few of **your own emails or posts** so it learns your writing voice

Easiest ways to hand it over (use whichever is simplest — no formatting needed):

- **Drag a file** into the chat, or **paste** the text, and say *"add this to my knowledge."*
- Or say *"read the files in this folder"* and point it at where your materials live.

(Behind the scenes, your raw files are kept in a "source inbox" folder inside your profile as a record; the engine condenses them into its working knowledge. You don't need to manage that folder — the assistant handles it.)

Part C — Review for gaps and conflicts

Now ask the engine to sanity-check your materials against what it drafted. Paste this:

Review everything I gave you against my current knowledge. Tell me: (1) any inconsistencies — where a document contradicts what you have on file, like an old metric or a renamed product; (2) any conflicts — where two of my documents disagree with each other; (3) any gaps — important facts in my materials you haven't captured yet. Then show me the exact changes you'd make to fix each one, and let me approve them before you save anything.

Read what it proposes and approve the changes you agree with. This is your chance to catch anything it got confidently wrong before it becomes your engine's memory.

Any time you get new material later, just drop it in and say *"learn from my new material."*

Step 6 — Connect your data tools (*optional — later is fine*)

The engine works right away using free web search. Connecting real data tools upgrades it from "educated guesses" to **verified contacts and live buyer-intent**. You can skip this now and come back when you feel the need.

Two things for each tool below: sign up on that company's own website first, then connect it in Claude. Your login stays with that service (or in Claude's secure connector store) — it's never written into the engine's files.

The tools worth knowing

Tool	What it gives you	1. Sign up here	2. Then connect via
Vibe Prospecting	Finds <i>companies</i> that fit your ICP, plus firmographics, buyer-intent, and events	vibeprospecting.explorium.ai	Claude Settings → Connectors → Add custom connector (see exact address below)

Higgsfield	AI-generated visuals for carousels and infographics	higgsfield.ai	Claude Settings → Connectors → search "Higgsfield"
Apollo	Backup for finding a person's email, plus company buying-signals, when RocketReach doesn't have them	apollo.io	Claude Settings → Connectors → search "Apollo"
RocketReach	Finds the <i>person</i> — verified email + direct phone, plus hiring/news signals	rocketreach.co	Needs an account key and a bit more setup — ask your admin

Vibe Prospecting's exact connector address (it won't show up in a name search — use "Add custom connector" instead):
<https://vibeprospecting.explorium.ai/mcp>

Advanced (your admin sets these up — not a self-serve connect):

Tool	What it gives you	Website
Syften	Live social-listening — finds people online asking about problems your product solves	syften.com
Email Sequencer (e.g. Saleshandy)	Multi-step outbound email campaigns — always staged paused ; a human reviews and activates each one	saleshandy.com

Prefer fewer, more personal emails over an automated sequencer? Connect your own **Gmail** account instead (Claude **Settings** → **Connectors** → search "Gmail") and ask the assistant to draft an email to a specific prospect. It writes the draft; you copy or forward it from your own inbox to actually send. This suits reps doing smaller, highly targeted outreach rather than big campaigns — and Gmail is still never sent from automatically, same rule as everything else.

Want to check what's connected? Just ask: *"What data tools do I have connected right now?"*

Step 7 — Start working

Just say these in plain English:

Find & research buyers

- *"Run my prospecting"* — find, score, and enrich accounts that fit your ICP

- "Prep me for my call with [company]" — the buyer, their persona, matched proof stories
- "Make a dossier for [account]" — a ~4-page meeting-prep brief
- "Build an account plan for [company]"

Reach out

- "Draft outreach to [name] at [company]"
- "Reply to this LinkedIn post" (paste it in)

Create content

- "Draft my LinkedIn post about [topic]"
- "Build a carousel about [topic]" · "add visuals to my carousel"
- "Make a one-pager for [account]"

Plan & stay current

- "Run my market scan" — this week's signals in your space
- "Build a deck for [company]"
- "Plan my quarter"
- "Schedule my weekly market scan and prospecting" — runs automatically each Monday

Not sure what to ask? Type "what can you help me with?" — the engine knows its own abilities.

The golden rules (read these once)

- **You're always the last step.** The engine drafts; nothing is emailed, posted, or published until *you* press the button in the real tool. There is no auto-send — by design.
- **Your logins stay yours.** No password, key, or token is ever written into the engine's files. If you try to paste one into chat, it stops you.
- **You talk; it does the technical work.** If a step ever seems to want *you* to type commands in a terminal, that's the advanced path — ask your admin.
- **Start free, add tools when you feel the gap.** Every data tool is optional and falls back to web search.
- **Feed it and it sharpens.** The more real material you give it, the more it sounds like you.

Mini-glossary

Term	In plain English
Desktop app	The Claude program on your computer — where you do everything
GitHub	The website that stores the engine's code
Repository ("repo")	The folder of engine code you download

Clone	To download your own copy of that folder (the assistant does this)
Profile	The engine's memory of your company — built during "set me up"
Connector	A plug in the app that lets the assistant use an outside tool (like Vibe)
MCP / API / VPS / CLI	Developer plumbing — out of scope ; you never touch these
